Abstract (en)

[origin: EP0454933A1] From the stretched and protected site which allows its transport with minimum encumbering, the container can be brought in position by a linear actuator (2) which lets the case (4) turn on hinge (5) while the cover (6), articulated on the said case by means of hing (7), is lifted by two tie rods (8) on joints (9) which keep it back on lug bolts (11). The covering device, collected in its seat (13) and consisting of a cloth (14) and of counterposed stick-systems (15) on radial imposers (16) guided by arms (17), is opened by two linear actuators (18) which through racks (20) drive the gear wheels (21) of the driving equipments (22). In closed position, the complete reentering of the cloth is allowed by a device with a mobile frame (23) which, after having been lifted by the linear actuators (26), drags a residual outboarding part of the cloth. <IMAGE>
