Abstract (en)
A motor cyclist's knee-slider comprises sector-shaped wear pad portions (32) flexibly connected together by integrally formed webs (34), so as to be capable of assuming a variety of orientations, each providing a different ground engaging surface. The knee-slider pad portions (32), or a pad of other shape, can be connected to fastener sheet material (36) by stitching (40) at the outer edge to provide better adaptation to the shape of a co-operating fastener sheet material (41). <IMAGE>
