Abstract (en)

[origin: WO9108114A1] A web, e.g. of sign-making stock, is disclosed having a novel configuration of drive holes down each longitudinal edge for engagement by the spaced pins of the two sprocket drive wheels used in web handling apparatus to advance the web into a machine. According to the disclosure, alternating with the sprocket holes (2, 2') down each side of the web (1) are elongated slots (3, 3'), which enable the web to be used with machines of the type described in EP-B-0134064 and which have an extra pin on each sprocket wheel as a means of ensuring accurate registration of the web when being loaded into the machine.
