Abstract (en)
[origin: EP0456203A2] A containment device (10), preferably for substances which are hazardous to health, is proposed, which consists of an outer container (12) and, arranged therein at a distance, an inner container (14). In this connection, the inner container (14) is separated from the outer container (12) via web elements (20, 22) consisting of dimensionally stable (first) insulating material, the intermediate space between the web elements being filled with a second insulating material (26). Moreover, insulating material (48) provided between the first and second cover element (15, 16) is arranged on the second cover (15) which closes the containment device (10) on the outside. <IMAGE>
