Abstract (en)

[origin: CA2041929A1] A connector bank for telecommunication systems is disclosed comprising connecting elements for cable wire, and contact elements for electrical connection of the connecting elements with the circuit tracks of a printed-circuit board. In order to prevent transfer of connection and disconnection forces to the contact elements, when cable wires are connected to, or disconnected from, the connecting elements, the contact elements are provided as separate components comprised of a contact pin and a plug connector member adapted to form an electrical connection with a respective connecting element. By this means, an electrical connection is maintained while allowing relative movement between each connecting element and its associated contact element.
