Abstract (en)  
[origin: EP0457099A1] The invention relates to a device for filling containers having an elongate cross-section with textile material. Various types of such filling stations are known in practice which are, however, not sufficient with regard to optimum filling of the can and with reference to a fully automatic system. Therefore, it is suggested to suspend the container via detachable holding elements (7,22) secured to sliding arrangements (9,25). Advantageously it is further proposed to assign to the container (2) an external lifter mechanism (36) which can be coupled to the can (2), during the filling operation. <IMAGE>
