Abstract (en)

[origin: EP0457146A1] The invention relates to a procedure for the fitting of decks on ships' superstructures, in particular for the subsequent fitting of additional decks. In the procedure according to the invention, first of all several completely assembled deckhouse modules (10) not yet torsionally rigid in themselves are produced ashore, and girders (2, 3) for forming a flat, robust location surface and for the load distribution are attached to the outside of the existing superstructure (1). The deckhouse modules (10) are then set down on the girders (2, 3) and are fastened to them, and then the deckhouse modules (10) standing side by side are connected to one another. The invention also relates to facilities for carrying out the procedure, such as the corresponding deckhouse modules as well as a special cross piece for transporting the deckhouse modules (not yet torsionally rigid). <IMAGE>
