Abstract (en)

[origin: EP0457411A1] The invention relates to a method for separating a light material fraction from a heavy material fraction from a mixture of the two fractions of solid materials, whereby said mixture is introduced into a liquid bath, in which the heavy fraction is allowed to settle. Near the upper side of the bath the mixture is evenly supplied in a direction at least substantially parallel to the liquid surface of the bath. The light fraction is discharged at the upper side of the bath along with outflowing liquid in a point which is located at least substantially directly opposite the supply point of the material into the bath. <IMAGE>
