Abstract (en)  
[origin: EP0459876A1] This terminal-adaptor connector device is especially provided for receiving adaptation and/or simulation elements (4), of significant volume, when there is restricted room for connecting it. It consists of a flexible printed circuit (3) for supporting the said elements (4) and connecting them to the connector (2). The linkage between the connector (2) and the circuit (3) is obtained by means of slotted self-stripping connections (6) which are carried by the said connector and which tightly grip, in their slots (60), the conductive ends (31) of the circuit (3) which are specially adapted for this purpose. The assembly may then be contained in a small-size casing. <??>Application: line-termination connectors.
