Abstract (en)

[origin: EP0460334A2] The applicator has a frame (1) with two metallic plates (2) fixed inside it. The plates are joined to electric heating elements (7) and transmit the heat to a reservoir (5) which contains the wax. The reservoir has a head at the front which holds a roller (6). One side of each plate is bent at a right angle to form a rectangular body. A tongue (10), cut out in each plate, extends inwards and forms an intermediate partition. The reservoir has a longitudinal notch (11), opening backwards, into which the partition fits.
