Abstract (en)
In a ski having a ski binding member (2) for fastening a boot (3) to the ski (1), a device includes, at the interspace between the tip (4) of the ski and the binding (2), two or more covering elements (5,6,7) which are mutually interconnected by one or more means (20,21) for varying flexibility and for damping vibrations. A ski device is thus obtained in which the skier can, according to the specific requirements, make the ski more or less flexible, thus improving its performance. <IMAGE>
