Abstract (en)

In the drafting device, which comprises a control system consisting of two endless movable elements, between which the material passes and which each consist of a succession of transverse bars 1 carrying needles on their transverse central part 4, this transverse part 4 is offset forwards in relation to the end transverse parts 5, 6 for mounting on the drive means and for support, as seen in the direction of advance A of the bars in the active control zone, and one of the two end mounting parts is extended beyond the respective drive means by a bent guide part 16, the active end 18 of which cooperates with guide means ensuring the control of the angular position of the bar about its transverse pivot axis in relation to the drive means. <IMAGE>
