Abstract (en)

[origin: WO9110059A1] In a fuel injection device for injection-type internal combustion engines, with a main injection piston (4) and pre-injection piston (1) which is coaxial with, separate from, and of smaller diameter than the latter, the lifting movement of the pre-injection piston (1) is imparted by the main injection piston (4), which drives the pre-injection piston (1) non-positively against the force of at least one spring (5) that holds it against the main injection piston (4). During the main injection, the working space (13) of the pre-injection piston (1) communicates with the working space (8) of the main injection piston (4), so that after the end of pre-injection and an injection pause, the pre-injection piston (1) delivers part of the main quantity of injected fuel and the fuel pressure generated in the working space (13) of the pre-injection piston (1) boosts the action of the spring (5).
