Abstract (en)

[origin: EP0461371A1] In a device for optionally proportioning different flowable paint masses, in which paint mass is released from a plurality of stock containers (3) into a collecting vessel (4), the stock containers are either pressurised gas cylinders containing paint mass or containers with elastically extensible interior sacks (28) which contain paint mass, the sack material of which has a high resilience and which are fitted with a product-dispensing valve (6). This makes it possible to stock different base paints with protection from oxygen and to release them in portions, to install the base paints in an easily exchangeable manner and to omit equipment components to which not negligible paint residues can permanently adhere. <IMAGE>
