Abstract (en)

[origin: EP0461446A1] In a zonal defence mine, by means of at least one adjusting member (8, 8') between the standing structure (3) and active-body mounting (2, 2'), themselves connected to one another via a cardan joint (4), the inclination at which an active body (1, 1') can rise from a stand-by position or be fired can be changed. The mine combats an object within a specific zone in the same way and with the same reliability as hitherto, but a substantially larger field can be defended by means of this device: the mine is transported to the "correct" location within the larger field. <IMAGE>
