Abstract (en)

This closing joint is interposed between two moving panels (3, 4) of a folding door, articulated with each other about an axis by articulation means. It is constituted by a flexible tubular profile (24, 25) disposed on the edge (26, 27) of the panels (3, 4), the latter having no mechanical connection between them. The joint occupies a space (e) between the panels, the articulation means being located outside of the said space (e) at the top and bottom parts of the said panels. The flexible tubular profile (24, 25) comprises a semi-rigid zone (28) and an elastically deformable zone (29), having an anti-pinching effect. Application to lift doors.
