Abstract (en)

[origin: EP0463394A1] An electromagnetically actuated directional valve is controlled or regulated via two pilot valves (41, 55) which are jointly attached to an end face of the valve body (10). The spool (18) is moved via two actuating pistons (27, 28). Via passages in the valve housing (10), in the valve cap (32) and in the intermediate flange (36), pressure medium is admitted in each case on one side to the actuating pistons from one of the two pilot valves, allocated in each case to a pressure space (30, 31). The pressure medium can be supplied to the pilot valves via automatic control or remote control. <IMAGE>
