Abstract (en)

[origin: EP0463671A1] A waste pickling bath which contains metal salts and acids, is produced in the surface treatment of rolled steel products and contains nitric and hydrofluoric acids and nickel, chromium and iron salts is subjected to an acid dialysis and a membrane electrolysis. In order to achieve a high return rate of free acids and a recovery of the metals in a form permitting direct use in the melt process, after the recovery of the free nitric acid and hydrofluoric acid in the acid dialysis the discharge, in which the concentration of free acids has been reduced, from the acid dialysis is subjected to a membrane electrolysis to recover the metals, and the overflow, in which the concentration of free acids has been increased, from the acid dialysis and the discharge, in which the concentration of metals has been reduced, from the membrane electrolysis are subjected to evaporation. <IMAGE>
