Abstract (en)

[origin: EP0463709A2] The invention relates to a method for running along the façade of a building, in particular a building with a sloping and/or overhanging façade, with the cradle of a façade elevator. Such façade elevators, suspended on carrying ropes, are capable of moving along the building in the vertical direction. To prevent the cradle from swaying, a guide rope is attached, at the start of the running procedure of the cradle, to a fixed point of the building-façade and successive connection to and detachment from the guide rope is carried out during the travelling procedure. Corresponding devices are provided on the cradle for this purpose.
