Abstract (en)

[origin: WO9011482A1] The invention concerns a process for orienting the fibre-like macromolecules of monofilaments in an assembly of monofilaments, using air at a given temperature. The monofilaments are processed using a series of any number of individual flow zones arranged in a row, the flow zones extending at right angles to the direction of motion of the monofilaments. The advantage of the invention is that, with extremely precise control of the temperature, each individual monofilament in the assembly is subjected to the same uniform stress.
