Abstract (en)

[origin: EP0465209A2] A combined input scanner and output scanner has a frame assembly, a document transport (35, 42) to transport a document through the scanner in a path in a first direction and a copy sheet transport (35, 42) to transport a copy sheet through the scanner, a document registration gate (44) and a copy sheet registration gate (47). The document registration gate (44) is provided on a cover (11) pivotally mounted (41) on the machine for movement between an open and a closed position over the document transport path. The document registration gate (47) is provided adjacent the downstream end of the cover (11) and extends into the document transport path to register the lead edge of a document when the cover is in the open position. The copy sheet registration gate (47) is moved into the copy sheet transport path to register the lead edge of a copy sheet when the cover is in the open position. The cover (11) has a tab (68) for removing the copy sheet registration gate (47) from the copy sheet transport when the cover is in the closed position over the document transport path. <IMAGE>
