Abstract (en)

[origin: EP0465705A1] The invention relates to a device for conditioning of liquid fuel and liquid coolant, and is applied especially to improve operation of internal-combustion engines, carburettor engines or compression-ignition engines, as well as gas and oil burners. The device comprises a body (1) in which a magnetic pile is situated incorporating permanent magnets (2) and pole shoes (3) or electromagnets. The body has two built-in independent flow circuits of conditioned agents. The liquid coolant circuit comprises a channel (5) between the wall of the body (1) and the magnetic pile (2), and a fuel conduit (8) in the form of a coil pipe with an odd number of coils, situated outside the magnetic pile (2) or inside the pile, incorporating a bed of ferromagnetic filings on which a magnetic field acts and through which fuel or gas being conditioned flows.
