Abstract (en)

[origin: EP0466049A1] A drafting machine is driven by means of a plurality of drive motors (7) of regulated position. For this, the motors (7) each have an individual control circuit (8a-8d). According to this invention, each such control circuit will comprise a position sensor (8.1, 8.2, 36) which can also additionally supply a position signal when the motor shaft does not rotate. <IMAGE>
