Abstract (en)  
Supply air device intended for placing in the vicinity of the floor in a room. The device is adjustable between two different operational states, namely one for normal operation where air at, or below, room temperature flows out at a low flow rate substantially over the entire outflow zone (Z1,Z2) of the device, and another state for heat-supplying operation, air at above room temperature being caused to flow out with a relatively high flow rate exclusively from a lower outflow zone (Z1). The adjustment is achieved with the aid of flap and/or screening means (11). <IMAGE>
