Abstract (en)

[origin: WO9011895A1] A device for feeding laterally perforated continuous stationery (12) into the conveyor (44) of a transfer station (17) of a non-mechanical printer, in which the transfer station (17) has paper transport clamps (44) engaging in the lateral perforations of the continuous stationery (12), which may be driven in the transport direction on both the input and output sides, and in which a paper brake (31) actuatable as necessary is arranged in the transport direction in front of the conveyor (47) on the input side. To feed the continuous stationery (12) accurately after it has been laid in the paper conveyor (48) on the output side there is a switching device (D, C) which, when the paper brake (31) is actuated, drives the paper conveyor (48) on the output side for at least a predeterminable feed time.
