Abstract (en)

[origin: EP0467108A2] A television signal receiving set contains in particular in a microcomputer (1) a programming device (9) with a programming program by means of which the programming device, using an abbreviated-name table (NK-Tab), which is contained in a memory (11) in the television signal receiving set and can be read out, generates a transmitter data table (SD-Tab), using the data determined, of the transmitters of individual stations which are adequately received at the receiving site. For generating this table, generally several tuning or search runs are required which are spaced further apart in time. A station location table (StPI-Tab), also generated within the programming program, is used, in conjunction with the transmitter data table, for automatically tuning to a selected individual station and for displaying an abbreviated name for this individual station. <IMAGE>
