Abstract (en)

[origin: EP0467833A1] The method for the neutralising of railway rails in situ involves causing at least one heating element (12) to travel continuously along the rails (R2), continuously measuring the temperature value of the rails before heating, measuring the value of the travelling speed of the heating elements in relation to the rails, measuring the value of the change in temperature of the rails after heating up to the moment when they are fastened in situ, and controlling the heating of the heating elements (12) as a function of said values. <IMAGE>
