Abstract (en)

[origin: EP0468096A1] In order to seal perforations (3, 4, 5, 6) and gaps in the bottom of the housing, filling containers (11, 12) are formed into the outer wall of the bottom part, from which distribution channels (13) lead to the individual sealing points. The distribution channels are split into partial channels (13a, 13b) by means of a centrally running distribution rib (14), as a result of which double channels with a correspondingly increased capillary effect lead to the individual sealing points.
