Abstract (en)

[origin: WO9013740A1] A fuel distributor for fuel injection installations in internal combustion engines has a distributor casing (10) with a plurality of drillings (11) interconnected by a fuel supply pipe to take electromagnetically actuated fuel injection valves (17), a clamp (22) stretched on the distributor casing (10) to hold the fuel injection valves (17) in the drillings (11) and means of securing on the inlet pipe (13) of the engine. To prevent the transmission of noise between the fuel distributor and the neighbouring components, a flat sound-insulating seal (25) is inserted between the distributor casing (10) and the clamp (22) and the securing means are made of oscillating metal components (32). Where the fuel distributor is made of plastic, the oscillating metal components (32) preferably consist of a turnbuckle (43), a metal spacer (45) and an elastic sleeve (36) which are arranged coaxially in the above order and pass through drillings (38, 39) in the distributor casing (10) and the clamp (22).
