Abstract (en)
[origin: WO9113817A1] The container comprises a serpentine heating means providing a flat upper surface (2) at the base of the container. The upper side (2) is designed directly to bear the material to be transported. A heating fluid may be injected into the hollow space of the heating means via an inlet aperture (6) and the heat is transmitted to the material by the entire upper surface (2) of the heating means. When said material is liquid, it may be removed via a blockable aperture (4) level with the upper surface (2).
