Abstract (en)
[origin: EP0471875A1] The invention relates to a railway goods wagon with fixed end walls (3) and a tarpaulin hood (4) extending between the end walls (3) and made of a multiplicity of bows (6) which bear a continuous tarpaulin (5) and can be moved in each case via running gear (7) on running rails (8) arranged in the region of the outer longitudinal carriers (9). Each end-side bow (6) can be locked to the end wall (3) at at least three points laterally and in the roof region. In order to be able to lock the end-side bows (6) centrally at all the locking points from each side of the wagon by actuating only a single lever (17) and in order to exclude erroneous actuations, the lateral locking devices (10s) can be actuated by means of a common actuation shaft (15) which is mounted on the respective end wall (3) and to which an essentially vertically extending actuation rod (28) is connected for the locking device (10d), which is arranged in the roof region with the inclusion of play at the start of the locking movement.
