Abstract (en)
[origin: EP0472985A2] A discharging device (1) has, for the discharge actuation (5), an element (29) which inhibits further actuation and engages automatically at the end of each actuation cycle. To cancel the inhibition, an actuation element (11, 23) must be manually turned, as a result of which control cams (33) of a discharge counter (20) are simultaneously transferred into a working position in such a way that they carry out a control step at the next stroke. <IMAGE>
