Abstract (en)

[origin: EP0476177A1] The building element, especially window, door or the like, comprises an outer frame which is to be joined fixedly to the building, and a wing frame mounted swivellably therein, the outer frame and wing frame being put together from wooden parts which have, in particular towards the inside of the frame, a milled profile. To make it possible to simplify manufacture and achieve a pleasing aesthetic appearance, the profile facing towards the inside of the frame is made as a base profile (4), which is identical for the outer frame (17) and wing frame (1), such that it has an essentially L-shaped configuration opening towards the inside of the building, the shorter leg (5) of the L in the outer frame (17) serving as a stop for the wing frame (1) and in the wing frame (1) as a stop for the wing frame panel, in particular a glazing (2), and the longer leg (7) of the L having two grooves (8, 9) running parallel to one another which are used in the outer frame (17) for securing fittings, such as closing plates (18) and the like, and in the wing frame (1) for ventilating the putty rebate of the glazing (2) or the like and for securing holding parts for the panel, in particular the glazing. <IMAGE>
