Abstract (en)

[origin: EP0477473A2] In a method for producing combination patterns, formed from a plurality of individual sewing patterns, by means of an electronically controlled sewing machine, which has a memory for many different individual sewing patterns and for a plurality of individual stitches having different directions of advance, at least one individual stitch being executed selectively between the formation of the last stitching of a first individual sewing pattern and the formation of the first stitching of a second individual sewing pattern, in order to produce a full-width combination pattern the transport of the sewing material takes place, for a predetermined number of individual stitches, at least partially transversely to the normal direction of advance or both in the normal direction of advance and transversely to this. <IMAGE>
