Abstract (en)
[origin: EP0479308A2] A building, in the walls, floors and/or ceilings of which there are provided hollow chambers (11, 12) designed to allow air or gas to flow through and extending substantially over the entire wall, floor and/or ceiling surface. According to the invention, the hollow chambers form in the walls (3, 4), floors (5) and/or ceilings (6, 7) a closed circulating-air chamber system extending annularly around the building or a part thereof, the walls, floors or ceilings being composed substantially over their entire thickness, i.e. their entire solid part, homogeneously of a water vapour-permeable material. In this arrangement, the hollow chambers can extend continuously around the building both in the vertical and in the horizontal direction. <IMAGE>
