Abstract (en)

[origin: EP0480118A1] To receive the fluid jet (15) in a fluid jet cutting machine (13), use is made of a grating structure (3) with an uneven surface, which possesses passage points (8) and is provided with a protective coating (6, 7). The surface, formed from strips (4, 5), exhibits grooves or channels (9) containing a gravel or glass filling (10). In this way, a highly resistant rebounding surface is formed and the reception of the cutting medium is facilitated. The device can be used both for dry-cutting and for cutting underwater. <IMAGE>
