Abstract (en)
[origin: EP0480240A1] In this sliding device to make a disconnection, the one clamping piece (2a) has a rearward guide strip (4) which is guided in a perforation (6) of a bent limb (5) of the one busbar part (1b). The other clamping piece (2b) has a rearward, angled extension (7) in which the free end of the guide strip (4) of the clamping piece (2a) is fixed after passing through the perforation (6). The two clamping pieces (2a, 2b) form a stable part connection, which can be displaced well. The clamping point, including the clamping screw (3) and together with the perforation (6) in the limb (5) of the busbar part (1b), forms a short, closed force system. <IMAGE>
