Abstract (en)
[origin: EP0481217A2] The invention relates to a building which consists of a static layer zone of a heat-insulating zone and of a weatherproof zone, the window required being formed from an inner window, arranged in the region of the static layer zone and/or the heat-insulating zone and which is to be opened, and a fixed outer window arranged in front of the inner window in the region of the weatherproof zone. Both windows are surrounded by horizontal and vertical bulkheads, so that a closed box space is formed, which is connected via a preferably adjustable opening to the air space existing between the weatherproof zone and the heat-insulating zone.
