Abstract (en)
[origin: EP0481223A1] A railway vehicle for controlling undesirable plant growth along railway lines in the region laterally adjoining the track region and ballast flanks, in particular the berm, having at least one radiator unit for generating electromagnetic radiation, in particular infrared radiation, which is mounted displaceably on the rail vehicle transversely with respect to the longitudinal direction of said vehicle. The radiator units are mounted in articulated fashion on an extension arm arranged on the upper side of the railway vehicle. To permit irradiation of the track region and ballast flanks on the one hand and berm or embankment on the other hand, the radiator units (3,3') are borne solely by the extension arm (20) and can be brought by means of the same over the upper side of the railway vehicle (1). <IMAGE>
