Abstract (en)
[origin: EP0482319A1] The device comprises a first chamber (1), which is formed by a container (4), and a second chamber (2) which is formed by a cylinder (8) and two tightly displaceable covering parts (9, 10). The covering parts (9, 10) are connected to an element (17) which is guided out through the closure part (19) of the discharge valve (7). By pulling on this element (17), the second chamber (2) with the second component is displaced relative to the cylinder (8) and first chamber (1) until the second component has forcibly been conveyed out of the cylinder (8). <??>The advantage of this arrangement is that the use of the device is independent of the components and the second component is introduced completely into the first component. <IMAGE>
