Abstract (en)
The present invention relates to a radiating convection heating apparatus which comprises two side wall compartments (2,3), between which a plurality of column-like elements (5) is arranged; the column-like elements extend between a lower manifold (6) and an upper manifold (7) so as to define a chamber for containing diathermic oil which can be heated by means of an electric resistor. The peculiarity of the invention is constituted by the fact that it comprises a fan (10) the air delivery whereof is connected to a heat exchange duct (20) which extends inside said upper manifold and exits at one (3) of said side wall compartments. <IMAGE>
