Abstract (en)
[origin: EP0483069A2] The binder possesses retaining strips with web parts and, in particular, spherical widenings. The web parts are removably received, when the binder is closed, by clamp protrusions on the top of the clamping web which possess longitudinal slots and perforations. The distance between two widenings of the retaining strips corresponds to the length of the perforations. The binder is produced from a resilient thermoplastic of high bending endurance. <IMAGE>
