Abstract (en)

For the extemporary preparation and administration of solutions of unstable or degradable solids a device is disclosed comprising a container (10) having the lower end open to which each time a cartridge (34) containing the desired dose of liquid solvent (24) is fastened, whereas at the upper end of said container, or in the side wall thereof an inlet opening (16) is provided for the introduction of a capsule (30) containing the solid solute to be dissolved in the afore said liquid; the introduction of the capsule in the said inlet opening automatically causes the capsule to be opened, whereby powdery solid solute can freely fall onto the surface and in the liquid solvent in which it is thereafter dissolved. <IMAGE>
