Abstract (en)
[origin: EP0484594A1] For the fastening of fitting plates, roses and the like in particular, the invention provides a cap-like plate (10) having a bevelled edge (14) which engages over a baseplate (20). It has, on at least two mutually opposed circumferential portions (26), spring-web catches (28) which interact non-positively with countercatches (18) on the inner face (16) of the edge of the attached plate (10). The catches (28) of the baseplate (20) are downwardly directed bending bars which are in one piece with the latter and which extend especially parallel to the baseplate underside and form barbs for the countercatches (18). Like these, they are profiled to project on the engagement faces, especially are sawtooth-like. The baseplate (20) forms, together with its catches (28), a zinc die-casting. The plate (10) is a sheet-metal body which is in one piece with the countercatches (18) and which can, for example, be stamped by means of a blanking die. During deep-drawing, the countercatches (18) acquire upwardly directed top edges projecting from the inner face (16) of the edge. <IMAGE>
