Abstract (en)

[origin: EP0484892A1] With a webbing-insulator element in the anchoring of radio masts, having at least one insulator which is surrounded by an insulator bracket on two mutually opposite sides, on whose free ends connecting elements to the adjacent insulator element or to an end element are mounted in a hinged manner, it is intended to create a solution which permits simpler and more cost-effective manufacture. This is achieved in that the insulator bracket consists of a steel segment (1) having a turned-out contact surface (1a) for the insulator (7) around which a bracket lug (2) is welded on, on whose ends lugs (8), in each case on both sides, engage as a connecting element to the adjacent insulator element or end element. The single figure is to be published with this abstract. <IMAGE>
