Abstract (en)

By a coating method in which a coating solution is supplied from a coating solution supply inlet of a solution injector, the coating solution is distributed in the width direction of the solution injector by means of a manifold, and then is discharged from the solution injector through a slot having an even interval from the manifold to thereby perform coating. The coating method is characterized in that an end portion of the manifold to which the coating solution touches has a curvature with which the portion introduces the coating solution in the direction to discharge the coating solution. <IMAGE>
