Abstract (en)

A sunroof assembly 10 for a motor vehicle has a closure member slideable across an opening between an open and closed position. Towards the leading edge of the sunroof opening and below the level of the closure member there are provided in line an infra-red light source 30 and an infra-red detector 32. With no obstruction in the opening the light pulses are detected by the latter. However obstruction in the path of the light pulses alters the output of a comparator 34 causing a micro controller 15 to stop further automatic movement of the roof closure member, manual further movement only being possible. <IMAGE>
