Abstract (en)

[origin: EP0485913A1] The invention relates to a bearing for a printing unit cylinder of a web-fed rotary printing machine, having an exchangeable jacket (2) which, for this purpose, can be pulled axially from the cylinder (1). An auxiliary device which supports the cylinder on one side during the jacket change is intended to retain said cylinder all-around, but not contact it during the printing operation. For this purpose, a slide (10, 21), which is arranged displaceably in the frame, supports the journal (3, 41) and partially surrounds it in a recess (15), can be engaged in each case on the journal (3, 41) by means of an eccentric (18, 23, 38) outside and/or inside the machine side wall (5) bearing the journal (3, 41) of the cylinder (1).
