Abstract (en)
A description is given of an intruder detector having two different detecting devices (10,30) for the same security zone, which triggers an alarm only if both detecting devices respond in a specific way, one detecting device being a glass breakage detecting device which comprises a glass breakage detector (30) and a bandpass filter (35) and the other detecting device being a pressure fluctuation detecting device which comprises a pressure detector (10) and a second bandpass filter (15), it being possible for the pressure detector and the glass breakage detector to be formed by a single sensing element. An alarm is triggered only if both detecting devices are addressed in specific frequency bands. <IMAGE>
