Abstract (en)
[origin: EP0486456A1] A transport wagon (16) with bogies (18) arranged at the ends comprises a girder-shaped vehicle frame (17) which is arranged centrally with respect to the bogie axles and is connected to a swivelling apparatus (22) designed for attaching a railway switch, the swivelling apparatus (22) being able to swivel, by means of drives (26), from a horizontal approximately vertical position about a swivel axis running in the longitudinal direction of the vehicle frame (17). The swivelling apparatus (22) is formed as a loading platform (24) or supporting frame which lies on the vehicle frame (17) and is composed of a large number of interconnected support elements (23) which run in the longitudinal and transverse directions of the wagon and are arranged in a common frame plane running parallel to the longitudinal direction of the wagon. The drives (26), which are at a spacing from one another in the longitudinal direction of the wagon, are each connected in articulated fashion to the vehicle frame (17) at the lower end region of a longitudinal side of said frame. <IMAGE>
